

# The facts about MERCURY400

- ◆ **True 400kg capacity.** Many sliding gate operators state a rated capacity but often this means it will “just do it” - “maybe once or twice”. We have personally seen this motor on test at SEA on much larger weights and operating continuously for twenty four hours a day. We still recommend good engineering practice means using on gates up to 200kg on level surfaces.
- ◆ **All metal gears and drive gear.** Most low capacity operators use plastic or nylon internally in the gearbox. Not SEA—all metal and all made internally for full quality control.
- ◆ **Superior base finish.** The base of the MERCURY is electronically bonded to give a long life anti corrosive finish.
- ◆ **Soft start and soft close.** You might pay a little more for a DC low voltage motor but when you see how smooth the gate runs it is worth every cent. The built in control board includes soft start and stop protecting your gate and gearbox and motor internals. Smooth operation and full control.
- ◆ **Safety first.** The logic control board is built to European safety standards and comes complete with all safety inputs like photocells and adjustable anti obstruction
